Seneca County EMS COVID-19 Transport Protocol Addendum November 18, 2020

EMS Transport of a Person under Investigation (PUI) or Patient with Confirmed COVID-19 to a Healthcare Facility (including interfacility transport)

If a patient with an exposure history or signs and symptoms suggestive of COVID-19 requires transport to a healthcare facility for further evaluation and management (subject to EMS medical direction), the following actions should occur during transport:

- EMS clinicians should notify the receiving healthcare facility that the patient has an exposure history and/or signs and symptoms suggestive of COVID-19 so that appropriate infection control precautions may be taken prior to patient arrival.
- Limit the number of EMS personnel to the minimum to provide effective care.
- Place N95 Mask on the patient if possible. All caregivers should wear N95 masks.
- Firefighters/EMR's that are dispatched to assist should limit patient contact as much as possible & wear an N95 mask if in close proximity of patient (less than 6').
- Keep the patient separated from other people as much as possible.
- Family members and other contacts of patients with possible COVID-19 should **not** ride in the transport vehicle, if possible. If riding in the transport vehicle, they should wear an N95 facemask.
- Isolate the ambulance driver from the patient compartment and keep pass-through doors and windows tightly shut. – Remove gloves, gown or other PPE while driving the ambulance but retain their N95.
- When possible, use vehicles that have isolated driver and patient compartments that can provide separate ventilation to each area.
 - Close the door/window between these compartments before bringing the patient on board.
 - During transport, vehicle ventilation in both compartments should be on non-recirculated mode to maximize air changes that reduce potentially infectious particles in the vehicle.
- If the vehicle has a rear exhaust fan, use it to draw air away from the cab, toward the patient-care area, and out the back end of the vehicle. If a vehicle without an isolated driver compartment and ventilation must be used, open the outside air vents in the driver area and turn on the rear exhaust ventilation fans to the highest setting. This will create a negative pressure gradient in the patient area.
 - Follow routine procedures for a transfer of the patient to the receiving healthcare facility (e.g., wheel the patient directly into an examination room).
